FORMATION OF SECURITY COMPETENCES IN LAW ENFORCEMENT ACTIVITIES

The research article focuses on the activities of law enforcement agencies, namely that the problems of the modern world provoke the need to form a new level of thinking in law enforcement agencies based on adequate risk perception, which is an

essential component of future analysis, a special method of cognition and management, which is the set of ways of making decisions.

The problem of analysis in the national security system is primarily related to the existing demand for operational analytics, PR and speechwriting. For top management, the most popular is situational analytics, which purpose is to respond quickly to events. It is with this approach that PR almost completely replaces the state security policy of law enforcement, and this has an extremely negative impact on the level of security analysis, as real analytics are replaced by PR materials.

In view of the above mentioned, as well as comparing the situation with other countries, we can state that in Ukraine there is no serious demand for strategic analysis. A significant obstacle in Ukraine is the extremely weak level, compared to developed countries, in optimizing the development of the informational society, extremely low support for their own centers for the study of the future. For example, in the United States there are hundreds of so-called “thought factories”, “brain centers”, associations of futurologists, which deal exclusively with futurological issues. Not so long ago, the CIA’s forecast-analytical material “World in 2020” appeared which caused a great resonance both in the United States and in the world.

In view of the above mentioned, Ukrainian society needs not only state support, but also civil society initiatives to create its own futurological infrastructure for analyzing and forecasting scenarios for the security development of the state in the information society.

In view of the above mentioned, Ukrainian society needs not only state support, but also civil society initiatives to create its own futurological infrastructure for analyzing and forecasting scenarios for the security development of the state in the information society. Assessing the usefulness of taking into account synergetic, non-linear metamorphoses, and not only linear and balanced processes, in today’s forecasting techniques in the segment of public relations, it is noted that safety forecasting in the information society should be based on awareness of possible side effects of destructive development and destructive development in general. This can be manifested in the reduction of economic efficiency of society and a safe environment, increasing of social tensions and the emergence of internal social conflicts, falling public morale and so on.

Key words: security, security science, law enforcement, forecasting, risk, threat, risk management, competencies.
